Farm Energy IQ

Farms Today Securing Our Energy Future

Biodiesel and Straight Vegetable Oil (SVO)

Chris Callahan, UVM Extension
Biodiesel and
Straight Vegetable Oil (SVO)
Outline

• Overview of Biodiesel and SVO – Why this matters.
• Biodiesel vs. SVO
• Making biodiesel
• Using SVO
• Using biodiesel
• What is B5, B20 and B100? And what should I use in my tractor?
• Equipment (engine) considerations when using biodiesel
• The safety considerations involved in making and using biodiesel
• Crops for SVO or biodiesel
• Basic agronomics and economics biodiesel crops
• Related equipment needed to process the crops to oil and meal.
• Examples
Benefits of SVO and Biodiesel

Financial – cost of fuel
Planning – stable of cost of fuel
Efficiency – “energy return on investment”
Environmental – net carbon reduction

“A hundred years ago we all grew our own fuel.”
John Williamson
State Line Farm Biofuels, Shaftsbury, VT
The Biodiesel Process
Lots of places to “hop on” or “hop off”
The Biodiesel Process

Lots of places to “hop on” or “hop off”

Oil for use as SVO or for making biodiesel can be collected from restaurants

... or can be grown and pressed on-farm.
On-Farm Biodiesel Production from Oilseeds

Case Study: Six Vermont Farms

Volume of production

697 gallons

486

2,475

11,400
Straight Vegetable Oil (SVO) vs. Biodiesel

- **SVO**
  - Mono, di, or triglycerides
  - Triglyceride shown
  - a.k.a. vegetable oil, fry oil, “grease”.
  - Filtered and de-watered
  - Usually requires secondary tank and heaters for use in diesel vehicle.

- **Biodiesel**
  - Mono alkyl esters, methyl esters
  - Refined oil, converted to “methylesters”
  - Lower viscosity, flows and sprays easier leading to better combustion
  - Lower gel and cloud point, better for winter use
Biodiesel Blends

• “B5,” “B20,” and “B100”
  – Simple ways of referring to the concentration of biodiesel in a fuel blend
  – When 5% biodiesel is mixed into petroleum diesel it is called B5

– Why is it blended?
  • Cold weather properties
  • Cost balance
  • Emissions balance
  • Material compatibility
  • Solvent properties

– B20 is most common blend
What Should I Use in My Tractor?

Straight Vegetable Oil Overview

- May require engine modifications
- Oil heated to change the viscosity
- Start engine on petro-diesel fuel
- Shut down on petro-diesel fuel

Vegetable oils have high viscosity which may lead to injector coking and eventual engine failure.

Engine deposit buildups after running on straight soybean oil

*Slide Credit: D. Schaufler, PSU – NewBio April 4, 2014.*
What Should I Use in My Tractor?

Biodiesel Overview

• Generally B20 is recommended
  – Some OEM’s have fully embraced B100 and their design process focuses on this

• B100 has been successfully used in tractors in the Northeast through winter
  – Farm-based production; i.e., from sunflower and canola oil

• If purchasing, seek BQ-9000 certification: [http://www.bq-9000.org/](http://www.bq-9000.org/)
What Should I Use in My Tractor?

• Things to watch for...
  – Engine may run more quietly
    • Biodiesel has lubrication properties
  – May have reduced power
    • Biodiesel has lower Btu content per gallon
    • Generally 2% reduction in power, 3% reduction in fuel economy (B20)
  – Filters may clog more frequently
    • Generally because biodiesel is “kicking up” sediment in tanks
    • Can also be due to off-spec biodiesel
  – Cold weather gelling and poor flow can occur
    • Depends on feedstock
Safety Guidelines

- Penn State Guide
- Small scale
- Somewhat PA specific, but extremely helpful
- Best single source for this sort of info

http://pubs.cas.psu.edu/FreePubs/pdfs/agrs103.pdf
PPE: Personal Protective Equipment

- Eyes
- Ears
- Mouth and nose
- Skin

Material safety data sheets (MSDS’s) for each material or chemical will provide guidance on proper PPE. Copies of MSDS’s for each chemical in use should be on-hand and easily accessible by all personnel.
Crops for SVO or Biodiesel
What are Oilseeds?

Grains and Oilseeds:
“Grains are identified as cereals suitable as food for human beings. Oilseeds are those grains that are also valuable for the oil content they produce.”

Soybeans
Canola
Sunflower
Camelina
Crambe
Flax
Mustard
Pennycress
Rapeseed
Safflower
Crop Production

• Recently published handbook for Northeast oilseed production

Oilseed Pressing Costs

Sunflower Seed
1 ton
@ $338/ton
(38% oil, 62% meal)

Pressing
(@ $2.36/ton)
Cost of Pressed Seed is $340/ton

Oil
0.38 ton oil
per ton seed
@ $129

Oil
@ $340 per ton
requires 2.63 ton seed
($1.28/gal)

Meal
0.62 ton meal
per ton seed
@ $211

Meal
@ $340 per ton
requires 1.61 ton seed
Economics and Breakeven of On-Farm Biodiesel Enterprises

- 2013 report explored 2 scales of farm-based production
- As with most farm operations, highly dependent on cost of crop production and yield
- Analysis is provided in step-by-step form
- Calculator is available to aid in assessing potential

Breakeven Pricing for Sunflower Products at Various Costs of Crop Production and Yield

Note: Unless otherwise noted, all acreage above are net acres. These figures do not account for necessary rotation acres (4-5 x annual net oilseed acres), which will be necessary for sustained production as well as minimized pest and disease pressure. If the oilseed production is integrated with a diversified crop enterprise, this may not be a large factor in the operation.
